Summary of Characteristics for all Reservoirs. . . . . 14

## INTRODUCTION

This inventory is an in depth look at the characteristics of one of Colorado's most valuable resources -- its front range high mountain water reservoirs. These reservoirs are storage and control points within a complex delivery system of water for agricultural, industrial, and municipal users. However, in more recent years, other water users have placed increasing demands on the water. As recreation, fish and game, pollution control and others have become recognized as highly important uses of the water, decisions on water allocation have become increasingly more complex. Limited water supply in combination with increasing water demands dictates that intelligent decisions be made on efficient multiple use of our scarce water resources. Colorado is presently entrenched in this difficult decision process. It is essential that those who must make and implement these decisions have accurate, readily available information on the water resource which is being considered.

Therefore, this inventory has been undertaken to provide a single core of accurate and current reservoir data for decision making, planning and management. It is expected that all levels of government (federal, state and local) with water and land use planning and management responsibilities will find this data helpful.

The need for the inventory became apparent in June of 1973, when these authors attempted to gather reservoir data for research on the recreation potential of the Colorado Front Range mountain reservoirs. Nowhere was the data readily available which was needed for the research. Nor were the accurate specialized type of data needed for water decision making and planning readily available. Reservoir resource data were found to be scattered

and in many cases impossible to locate in existing records. Not only was the specialized type of data needed for decision making not available, but basic reservoir data were found to be lacking. Such basic information as how many reservoirs exist, where they are located, and who the owners are was lacking.

A basic core of information was found in the State Water Engineers Office. However, the data were never collected or intended for the type of water planning or decision making which faces Colorado today. Many more types of users and water demands require that many more types of information than is presently provided by the State Water Engineers Office be made available to the decision makers. Furthermore, much of the existing data were found to be outdated or inaccurate.

The information presented in this inventory attempts to fill in the data gaps, update data, and validate data. The data are a result of three years of extensive search by Colorado State University investigators. There were 131 reservoirs identified. Data were collected on these reservoirs starting with the State Water Engineers records and working through other state, county and city records. Much data came from interviews with highly knowledgeable individuals from both the public and private sector. Finally, data were collected and validated through on-site visits to all of the reservoirs.

Accuracy of the data is only as good as the sources of information used and our ability to verify the data. Verification was not possible in all cases, and over a three year period some data may have changed. However, every effort has been made to provide accurate, up-to-date information. It is believed that the information presented here represents the most accurate, concise,

and up-to-date inventory of the water reservoir resource of the front range mountains of Colorado.

## INVENTORY AREA

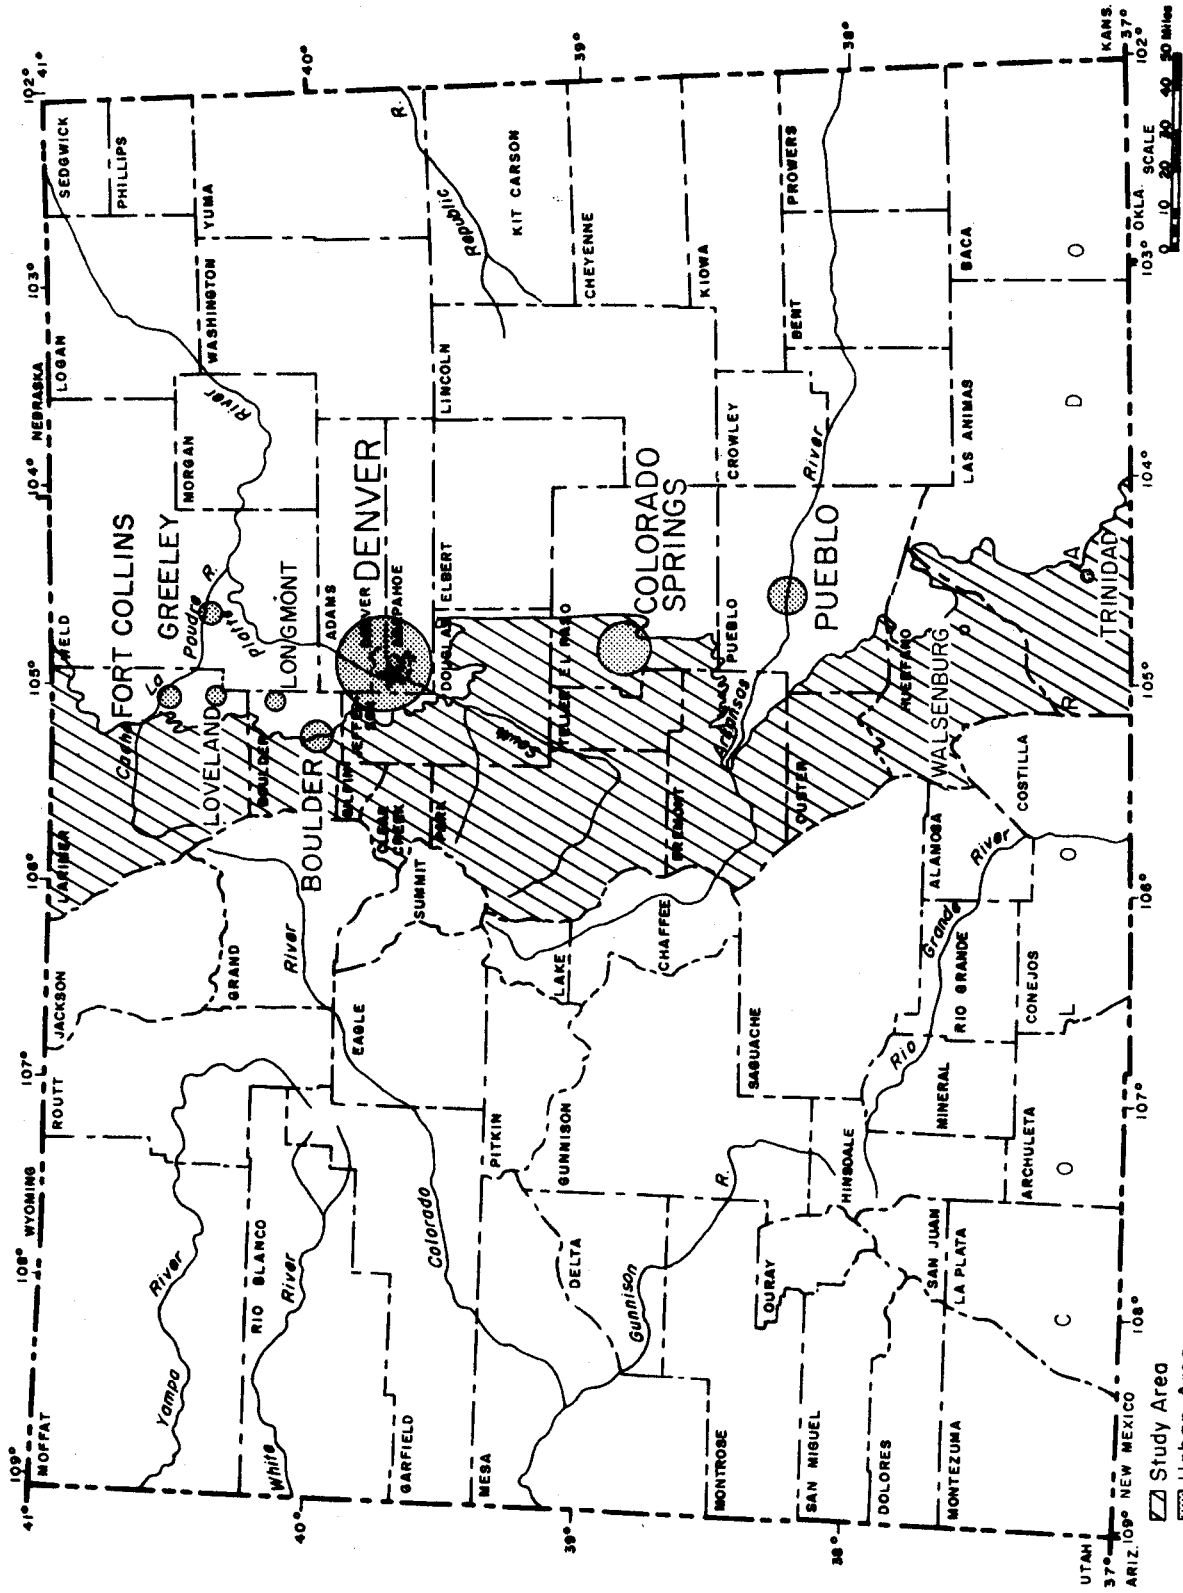

The inventory area is shown by the cross-hatched pattern on the map on Page 1. It covers the length of Colorado, and is bordered on the north and south by the Wyoming and New Mexico state lines. The eastern boundary is the 6,000-foot-elevation contour. The western boundary is the Continental Divide from the Wyoming border to approximately the center of the state, where the boundary becomes the Park and Fremont county lines. In the southern portion of the state, the western boundary is the Sangre de Cristo mountain range. The large park areas (North, Middle, South) of the state are excluded in order to retain reservoir setting in the montane, sub-alpine, and alpine life zones.

## LIMITATIONS

The data collection for this inventory is an ongoing process. Some of the data collected may already be outdated.

For some aspects of the study, information was impossible to obtain and in some cases information did not exist. Some data were also impossible to verify. This was due largely to the diverse nature of the reservoir system and the many agencies, groups, and individuals involved in management.

Throughout the inventory area, the size (surface acres) of reservoirs varies immensely. The inventory was limited mainly to reservoirs between ten and four hundred surface acres. However, certain exceptions are made for those reservoirs that do not meet this criterion, but whose overall characteristics are similar to the reservoirs within the ten to four hundred

Study Area

Study Area  
Urban Area

area criterion. The criteria for selecting these reservoirs between ten and four hundred surface acres is that most high country reservoirs fall within this range. Relatively few are larger, and those that are smaller are poorly suited for most major reservoir uses. Therefore, this inventory represents all of the high country reservoirs in the Colorado front range that are suitable for major use except for a few extremely large reservoirs.

#### DATA COLLECTION TECHNIQUES

The number of reservoirs surveyed for this inventory was 131. The data presented were collected in three phases. Initially, background information on the reservoir system was obtained through the State Engineer and the dam roster for Colorado. Additional background data were then assembled from state and county records for reservoirs and surrounding land. The second phase of the data collection involved members of the research team interviewing reservoir owners and managers. Contacts were then made with other groups and organizations associated with reservoir activities such as fishing and recreation clubs. The final phase of the data collection involved on-site observations by members of the research staff at the reservoirs. Each of thirty-six selected reservoirs was visited many times between 1973 and 1975. The remaining ninety-five reservoirs were visited between May and December of 1975. On-site observations enabled verification of records and collection of information unavailable through records and personal interviews.

## CONTENT AND HOW TO USE THE INVENTORY

In using this inventory, the reader can obtain information from two separate indexes. Index I presents reservoirs by water district. The information presented is general in nature. If more detailed information is required, then the reader may turn to Index II. This index lists the reservoirs in alphabetical order, and expands in some detail on the information in Index I. An explanation of just how Index II expands upon the data presented in Index I can be found at the beginning of Index II.

The basic data for Index I and II were collected for nineteen reservoir characteristics. Following is a brief explanation of each of the nineteen characteristics, and a summary of the the information collected for each characteristic. In addition, a summary table at the end of this section gives an overview, in numbers and percentages, of the information collected for all 131 reservoirs.

### Reservoir Characteristics:

**Access:** For the purpose of this study, access consists of two separate considerations. The first of these is whether a certain reservoir is presently available for recreational use by the general public. Hence, the designations "open" and "closed" refer to the recreational status of a given reservoir. A total of fifty-three reservoirs are now open for public recreation. The second consideration relative to access concerns the actual type of access route servicing each reservoir. The access types considered in this inventory are: paved roads, unpaved (maintained) roads, primitive roads, four-wheel drive roads, and foot or bridle paths. Twenty reservoirs in the study area are accessible by means of paved roads, seventy-seven by unpaved roads, eighteen by

means of primitive or four-wheel drive roads, and sixteen reservoirs are serviced by foot or bridle paths.

**Dam:** The types of dams found at reservoirs in the study area are: earth-fill; earth-concrete; concrete-stone; and a few are of other material. Sixty-three of the study reservoirs have earth-fill dams, twenty-nine have earth-stone dams, twenty-eight have concrete dams, seven have concrete-stone dams, and the remaining four reservoirs have some other type of dam structure such as steel.

**Drawdown:** Ninety-eight of the reservoirs, for which information is available, experience at least some degree of drawdown. Of these, nineteen are only slightly drawdown (a few feet in a given season), seventy-nine reservoirs are drawdown as needed to conservation pools and in some cases completely dry. Twenty-seven of the study reservoirs experience no drawdown. Information was not available on the remaining six reservoirs. Detailed information on drawdown at special reservoirs can be found in Index I of this report.

**Facilities:** For the purposes of this inventory, facilities are viewed as those man-made objects that contribute to the recreation experience. Parking lots, picnic tables, toilets, and boat ramps are examples of such facilities. The extent of facilities at high-mountain reservoirs plays an important role in determining the type of use a reservoir will receive. Four categories are utilized in grouping facilities:

Extensive: refers to reservoirs with a wide range of facilities (parking, picnic tables, fire grills, toilets, trash cans, etc.). This category is further broken down into day use and overnight classes. Day use facilities allow for such activities as picnicking, fishing, etc., but preclude any overnight camping. Overnight facilities (tent flats, trailer parking, etc) allow camping as well as the regular day-use activities.

Limited: refers to reservoirs at which fewer facilities exist (only toilets and trash cans for example). This category is also broken down

further into day-use and overnight facilities.

Residential: refers to reservoirs with adjacent homesites, cabins, etc. These types of reservoirs may or may not have recreational facilities required by the general public.

None: refers to reservoirs with no facilities.

Three of the study reservoirs have extensive day-use facilities, thirteen have extensive overnight facilities, sixteen reservoirs have limited day-use facilities, nine have limited overnight facilities, fifteen are residential, and seventy-four reservoirs have no facilities for recreational use.

**Fish Type:**

A variety of fish are to be found in Colorado's high-mountain reservoirs. Trout species are by far the most common. Six species of trout are encountered in the inventoried reservoirs:

Rainbow Trout (*Salmo gairdneri*) found in  
70 reservoirs

Brook Trout (*Salvelinus fontinalis*) found in  
44 reservoirs

Brown Trout (*Salmo trutta*) found in 15 reservoirs

Cutthroat Trout (*Salmo clarki*) found in 29  
reservoirs

Lake Trout (*Salvelinus namaycush*) found in 2  
reservoirs

Greenback Trout (*Salmo stomias*) found in 2  
reservoirs

Sockeye Salmon (*Oncorhynchus nerka*) found in  
3 reservoirs

Montana Grayling (*Thymallus montanus*) found in  
2 reservoirs

Great Northern Pike (*Esox lucius*), Yellow Perch (*Perca flavescens*), Smallmouth Bass (*Micropterus dolomieu*), Common Chub (*Semotilus atromaculatus*), Bluntnose Minnow and Longnose Suckers are also found at some reservoirs. Twenty-two reservoirs have no fish present.

**Spawning:**

Natural reproduction occurs at a number of Colorado's high-mountain reservoirs. Reservoirs were considered

to have spawning if the reproduction of a fish species within the reservoirs contributed a significant proportion of the resident fish population. Thirty-three reservoirs have fish spawning habitat, sixteen have slight spawning habitat, and forty-four have no spawning habitat. Sixteen reservoirs have no information concerning spawning. At twenty-two reservoirs the category is not applicable.

- Stocking:** For the purposes of this study, reservoirs are considered to have a stocking program only if they are stocked annually. Some of the study reservoirs are stocked intermittently, but these reservoirs have been placed in the "not stocked" category. However, the stocking rates of some of these intermittently-stocked reservoirs are included in the alphabetical listing of the study reservoirs (See Index II). Sixty-eight reservoirs are stocked on an annual basis, thirty-seven are not stocked or are stocked intermittently, and at twenty-six reservoirs, the category is not applicable or there is no information available concerning stocking rates.
- Winterkill:** Nine study reservoirs experience a winter-season loss of a significant portion of the resident fish population. Five reservoirs experience a slight winterkill, and sixty-eight reservoirs have no winterkill. Twenty-seven reservoirs had no data on winterkill. At twenty-two reservoirs winterkill is not an applicable category.
- Life Zone:** The reservoirs inventoried are found above six thousand feet elevation and are located in one of three life zones: montane, sub-alpine, or alpine. Seventy-six of the study reservoirs are found in the montane life zone, (6,000-9,000 feet), forty reservoirs are located in the sub-alpine life zone (9,000-11,500 feet), and fifteen reservoirs are located in the alpine life zone (above 11,500 feet).
- Location:** The study reservoirs are all to be found in the Colorado Front Range area east of the Continental Divide and extending north and south from the New Mexico and Wyoming state lines. In section I of the inventory, "location" refers to the county in

which a given reservoir is located. The study reservoirs are located in at least one of the fourteen Front Range counties.

**Onstream/  
Offstream:**

Reservoirs are considered to be onstream if they are directly connected to an inflow stream, creek, or river. Reservoirs that have inflow devices such as ditches, slurries, pipes, and tunnels are considered to be off-stream as are reservoirs that derive their water from springs or wells. Twenty-seven reservoirs are considered "offstream," 103 are considered "onstream," and one reservoir has no information.

**Water & Land  
Ownership:**

The two primary classifications within this category are; public and private. Water and/or land ownership is public when it is owned by the federal, state, or local government. Private ownership of the water and/or land, as the classification implies, refers to ownership by private individuals, groups, or organizations. For purposes of brevity, "public" and "private" are used in Index I; but a more complete listing of water and land ownership is given in Index II. Sixty-nine reservoirs have public ownership of water, seventy have public ownership of the land, sixty reservoirs have private ownership of the water, fifty-two have private ownership of the land.

**Recreation  
Activities:**

A variety of recreational pursuits can occur at the inventoried reservoirs where recreational use is allowed. These activities range from picnicking and camping to fishing, boating, and swimming. Eighty-three reservoirs offer boating, thirty-four allow camping, thirty-three have picnicking, nine reservoirs offer swimming, three reservoirs have near by golf courses, and two other reservoirs offer ice skating.

**Scenery:**

Evaluation of the scenic quality of high-mountain reservoirs is considered an integral part of the inventory. Observations made by members of the research team provide a basis for a system of classification based upon both the views from the reservoir and the attractiveness of the area

immediately surrounding the reservoir. This classification system compares all the reservoirs within the study area. A team approach was used for judging the aesthetics of each reservoir. Almost all of the inventoried reservoirs are of a higher scenic quality than water areas found in many other parts of the country, and all would most certainly appeal to most recreationists. Nevertheless, it was felt that some system, no matter how subjective, was needed to separate the high-mountain study reservoirs according to the degree of attractiveness. The classification for the system are:

Outstanding-- A reservoir with this rating exhibits superior conditions and views. Geologic and vegetative characteristics are very attractive, and the reservoir represents the highest quality scenery found at any of the study reservoirs.

Above

Average----- A reservoir receiving this rating would also have high-quality conditions and views but would lack some of the characteristics found in the outstanding reservoirs.

Average----- A reservoir in this class is considered a typical reservoir of the study area. Views and conditions are not distinctly spectacular.

Below

Average----- A reservoir receiving this rating has poor conditions in the immediately surrounding area and/or poor views from the reservoir.

Of the inventoried reservoirs, sixteen are considered to be in the outstanding class, thirty-four above average, thirty-seven average, and forty-three are considered below average.

- Storage Capacity:** No specific breakdown according to storage capacity is possible due to the great amount of reservoir size variation to be found in the study area. The reservoirs range from twelve acre feet to 43,000 acre feet. Because of the large differences in storage capacities between reservoirs, the reader is directed to the individual reservoirs (Index I and Index II) to ascertain desired storage capacities.
- Surface Acres:** The study reservoirs vary from approximately ten surface acres in size to over 375 surface acres. Fifty-four of the reservoirs are between zero and twenty-five surface acres, forty-three are between twenty-six and seventy-five surface acres, twenty-one are between seventy-six and 150 surface acres, five are between 151 and 250 surface acres, four are between 251 and 375 surface acres, and four reservoirs are over 375 surface acres in size.
- Water Use:** Municipal water supply, irrigation, recreation, and hydroelectric power production are the primary uses of water collected in the high-mountain reservoirs of the study area. These uses can occur individually or in some combination depending upon the compatibility of the individual uses. A plurality of the reservoirs inventoried are used only for municipal water supply; the next most frequently occurring category is recreational use of a combination or irrigation and recreational use. Index I and Index II give the exact water uses for each reservoir.

SUMMARY OF CHARACTERISTICS FOR ALL RESERVOIRS

<u>Reservoir Characteristics</u>		<u>Number Of Reservoirs</u>	<u>% Of Total</u>

## INDEX I

## RESERVOIRS BY WATER DISTRICT

In this portion of the inventory, data is presented for 131 high country reservoirs. These reservoirs are categorized according to the Colorado Water District in which they are located. The number of reservoirs within each district is as follows:

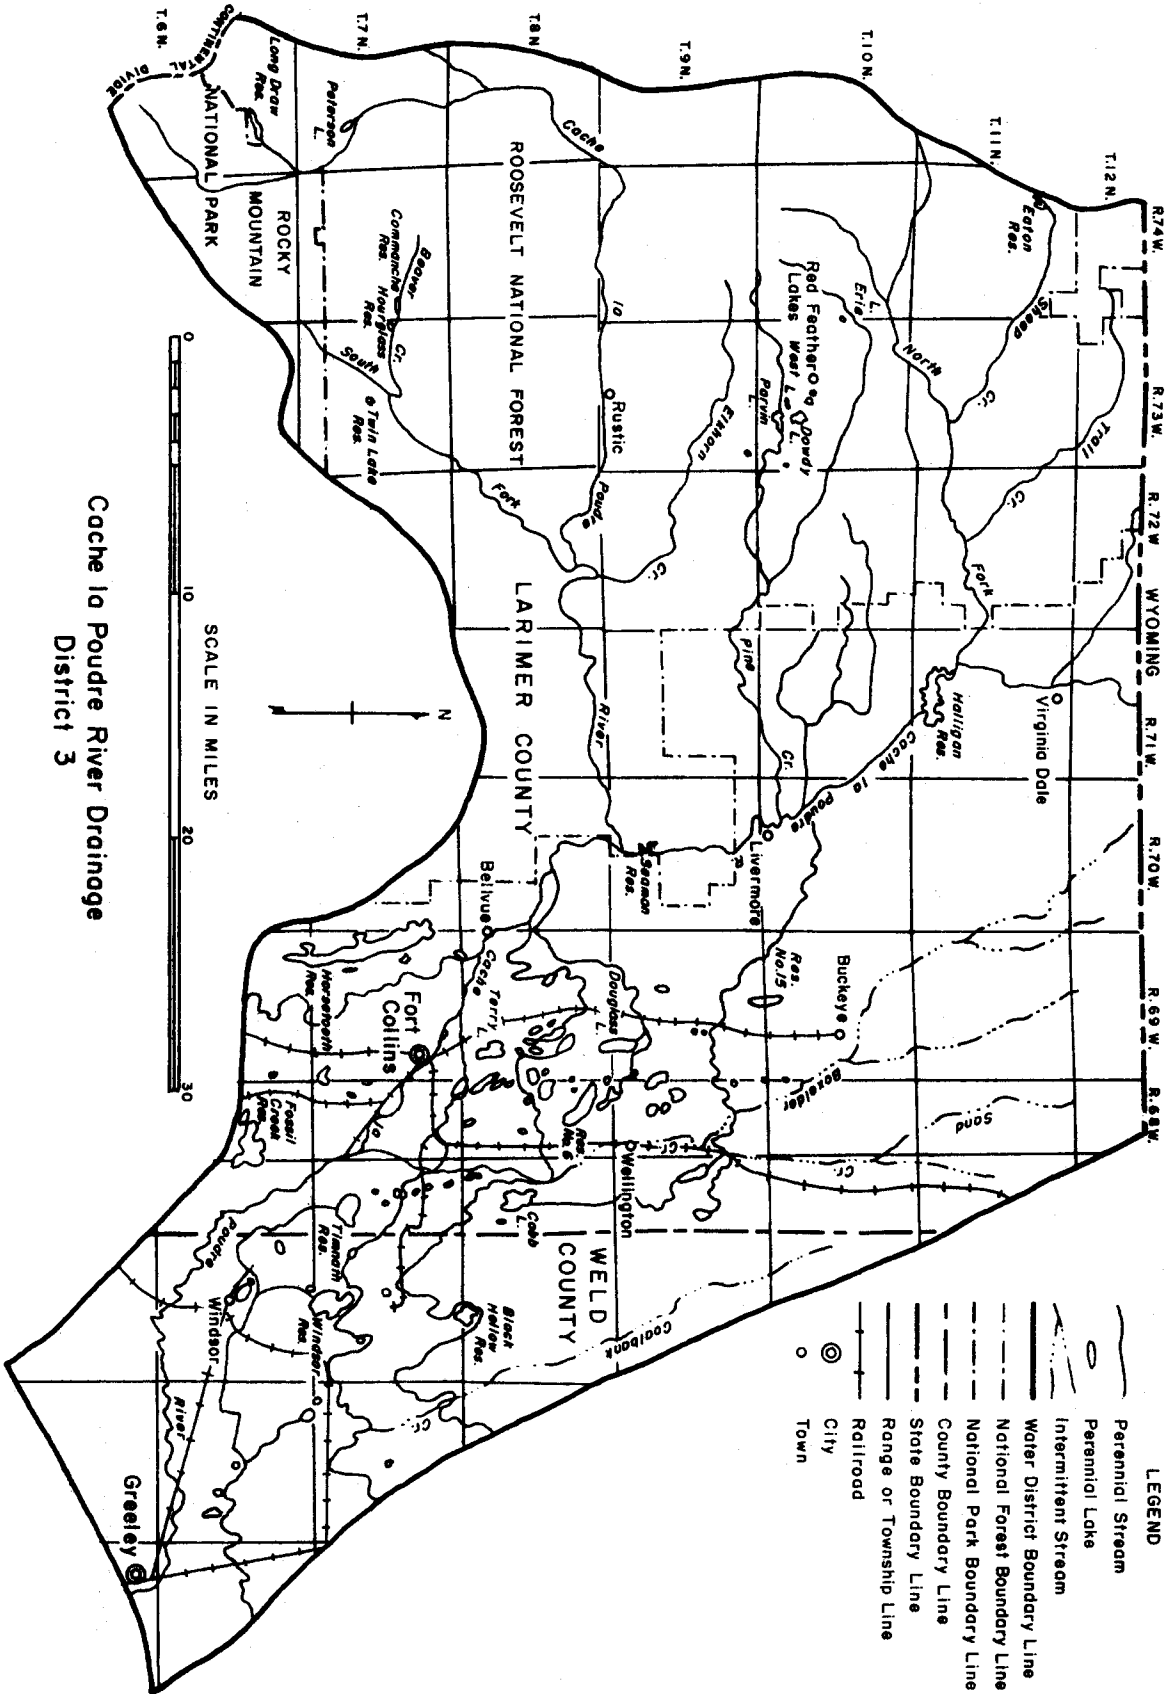

25 Reservoirs in Water District	3
5 Reservoirs in Water District	4
13 Reservoirs in Water District	5
15 Reservoirs in Water District	6
13 Reservoirs in Water District	7
3 Reservoirs in Water District	8
2 Reservoirs in Water District	9
15 Reservoirs in Water District	10
13 Reservoirs in Water District	12

INDEX II            RESERVOIRS IN ALPHABETICAL ORDER

This portion of the inventory presents data on 131 reservoirs listed alphabetically. The information in this section expands upon the data that appears in Index I, but the classification and definitions remain essentially the same. For this section, the data collected on drawdown are further divided into two parts. First, the amount of drawdown is presented and second, the times of drawdown are presented. The added classifications for the drawdown portion are:

Complete/Emptied--indicates that all of the water is taken from the reservoir.

Conservation Pool--indicates that enough water is remaining after drawdown to insure some habitat for aquatic organisms.

Volume--indicates number of acre feet withdrawn.

Vertical--indicates how many feet the water level is lowered during drawdown.

Slight--indicates very little drawdown. (Less than 2 vertical feet).

None--indicates that no drawdown takes place.

The data collected on facilities present at each reservoir is expanded in this section to indicate exactly what facilities are to be found at the reservoir and not just the type of recreational use (e.g. day use or overnight; extensive or limited) that the facilities are intended to support at a given reservoir.

Additional information is provided on fish and associated characteristics such as average fish size, details on stocking

patterns (number of fish stocked), and any other information that may be available.

Reservoir location is divided into three parts to include U.S.G.S. map coordinates, county, and water district.

Ownership of the water and surrounding land is expanded upon to indicate the exact individual owners. In cases in which the surrounding land has been subdivided, the term "subdivided" is used to indicate the situation. Individual ownerships are not given since the list of actual owners may be extensive. Ownership information may not report recent sales and transfers.
