Table S1. Feeding damage by the three herbivores and trypsin-inhibiting activity in poplar.

Table S2. Primer sequences used for cloning and qRT-PCR.

Table S3. Differential expression of contigs annotated as protease inhibitors in the transcriptome of black poplar leaves.

Table S4. Nomenclature of KTI homologs in this and other studies.

Table S5. Quantification cycles of the qRT-PCR analysis for individual *KTI* genes.

Table S1. Feeding damage on black poplar leaves after 2 d of herbivore feeding by *Lymantria dispar*, *Amata mogadorensis* and *Phratora vulgatissima* and trypsin-inhibiting activity in these leaves. Shown is the leaf area loss (% of total leaf area) and inhibitory activity (equivalents to soybean trypsin inhibitor (STI), µg STI g⁻¹ dry weight (DW)) as mean ± SEM ($n = 6$). The three groups were not found to be significantly different (ANOVA: $F_{(2)} = 0.762$; $P = 0.484$). Data are taken from Fabisch *et al.* (2019), and the parameters re-calculated for the six replicates selected for this study.

Herbivore	Damage (%)	KTI activity (µg g ⁻¹ DW)
<i>L. dispar</i>	19.0 ± 5.7	95.7 ± 12.9
<i>A. mogadorensis</i>	12.3 ± 4.8	93.1 ± 26.4
<i>P. vulgatissima</i>	12.0 ± 1.6	257.6 ± 23.2

Table S2. Sequences of primers used for full-length cloning (FL) and gene expression analysis via quantitative real-time PCR (qRT-PCR). Primer sequences for *Actin* were taken from Ramiraz-Carvajal et al. 2008¹.

Table S3. Contigs in the transcriptome of black poplar leaves damaged by *L. dispar* and *P. vulgatissima* that were annotated as protease inhibitors, and their differential expression (ratio of RPKM values) compared to the respective undamaged control treatments (Ctrl 1 and 2). Contigs are sorted by their regulation pattern (up-regulated, differentially regulated, down-regulated upon herbivory) and further by the *P*-value of 'Ctrl 1 vs. *L. dispar*' in descending significance. Annotations including 'Kunitz' are marked in bold; for these contigs, the gene names used in this study are given (PnKTI).

na - not available; this contig and its expression was taken from another transcriptome of the same *P. nigra* genotype (unpublished) with comparable *L. dispar*, but not *P. vulgatissima* herbivory treatment.

Table S4. Nomenclature of Kunitz-type protease inhibitors reported in this study and their corresponding homologs as Potri-IDs from the *Populus trichocarpa* genome v3.0 and genes described in other studies. Similarity values (% sim) show the percentage of identical base pairs between the respective sequences with those published in our study based on their full-length open reading frame, unless stated otherwise.
